ABSTRACT

The present study aims to examine the cost and returns of Chick pea. The study was conducted in Bemetara district of Chhattisgarh state. From the district two blocks namely Bemetara and Saja were selected and from bemetara block nine villages selected and six villages were selected from Saja block and fifteen chick-pea growing farmers were selected from each village for the investigation of the study. The primary data were collected from the 225 producers through personal interview by survey method. The finding of the study revealed that cost of cultivation per hectare of chick-pea was ₹32486.21 per ha. The cost of cultivation per hectare showed increasing trend with respect to the farm size of holdings. The cost of cultivation in case of marginal farm was higher (₹30469.98/ha.) followed by small farms (₹31235.90/ha.), medium farms (₹33587.90/ha.) and large (₹35839.01ha.) respectively. On an overall basis input-output ratio in chick-pea cultivation was 1:81. On an overall basis net return in chick-pea cultivation was ₹ 26574.80 per ha. The average yield of chick-pea in the study area was 13.03 qt/ha which shows very satisfactory result in respect to average yield of Chhattisgarh i.e. about 1.01 qt/ha.

1. INTRODUCTION

"Chickpea (Cicer arietinum (L.), commonly known as bengal gram or garbanzo, belongs to the family Leguminosae and is a major pulse crop that contributes ~20% of the world pulse production after dry beans and dry peas." Reddy et al. [1]. In many developing countries, chickpea is a major source of protein, especially among the poorest segments of the population who depend on vegetable sources to meet their protein and energy needs. In delivering a nutritionally healthy diet, chick-pea plays a major role. For vegetarians, this is the primary form of nutrition. India is the top manufacturer of chick peas in the world, followed by Canada, Chickpea is the second primary source of protein among all pulses in the Indian diet. India is chickpea's main manufacturer. customer and importer. There were large differences in both consumption and production of pulse crops to meet the growing domestic demand and to reduce imports and exploit export opportunities. "There should be greater emphasis on the adoption of improved package of practices against the existing traditional production technology so that the desired yield may be realized". Sharma and Zechariah [2]. For nutritional protection and environmental help, chick-pea is an important part of the Indian diet. Chickpea is cultivated primarily as a rainfed crop in India in almost all parts of the country (68 Chickpea percent area). production was projected at around 11.23 million tonnes (mt) during 2017-18, which is 46 percent of the overall production of pulses (23.95 mt) in India. In Chhattisgarh, in 2018-2019, pulse crops were grown in a sizeable area of 703.13 thousand tonnes of total production. Chhattisgarh's most important pulse crops are Lathyrus, Pigeon Pea, Chick-pea, Black Gram and Green Gram. The chick-pea is the most significant pulse crop in the state of Chhattisgarh. It currently occupies an of 33.09 thousand hectares, area with production in Chhattisgarh of 34.55 thousand metric tonnes. Bemetara. Rainandgaon, Kabirdham and Durg are the major districts for rising chickpeas. Bemetara district takes first position in area of gram with 10.42 thousand hectare with total production of 12.75 thousand metric tonnes with average yield of 1.22 ton per hectare. Chhattisgarh has many agricultural land patches where chickpea crops are produced in a larger region and more study is required to address questions such as, what is the

productivity level for major gram crops in the farmer's field? How much is the cultivation cost per area/product unit? How much is the additional return from advanced gram crop technologies over local ones? What is the cost benefit ratio for these crops? Keeping in view, all these questions, the present study was based.

2. METHODOLOGY

The cost concepts approach to farm costing is widely used in India. To work out the cost of cultivation standard method of cost of cultivation employed by Commission on Agricultural Costs and Price (CACP), Directorate of Economics and Statistics, Government of India was adopted which include Cost A1, Cost A2, Cost B1, Cost B2, Cost C1, Cost C2 and Cost C3.

Cost of production per quintal: The average cost of production per quintal has been worked out by dividing the cost (i.e. Cost "A", Cost "B" and Cost "C", respectively) by total output.

Input-Output ratio: Input-output ratio indicates the efficiency of input. It is computed as under:

Input-output ratio = Gross return / Total input cost.

Income analysis: Income analysis was made by using the following income parameters:

- 1. Farm business income = Gross income Cost "A1"
- Family labour income = Gross income Cost "B2"
- 3. Net income = Gross income Cost "C2"
- Farm investment income = Net income + Rental value of land + Interest on owned fixed capital

Returns: Returns were noted in physical quantities i.e. in quintals and the monetary values were calculated by taking into consideration their average market price.

3. RESULTS AND DISCUSSION

Cost of cultivation of chick pea is demonstrated in Table 1. It clearly indicates that in large farms, the cost of cultivation per hectare was higher than in small farms. The overall production cost per hectare of chick pea was found to be averaging was Rs. 32486.21 per hectare. For

(Rs.35839.01 large farms per ha) the production costs were higher than for marginal farms (Rs 30469 per ha), small (Rs. 31235 per ha.) and medium- sized farms (Rs. 33587 per ha.). Findings were supported by Hegde [3]. Cost of cultivation per hectare of different farm sizes shows an upward trend as the scale of the farm grew this was because the big farmers expended more on modern agricultural inputs such as quality seeds, fertilizers, plant safety products, skilled labor. Table 1 also revealed that under cost of cultivation the maximum cost shared by seed which is 4705.75 (14.48%) on an average basis which varies from 4176 at marginal farmer to 5317.60 at large farmer. Total labor cost share (hired + family) 4976.11 in cost of cultivation where hired labor charge is maximum 2759.32 (8.49%) on an average basis hired labor charges incurred maximum in the case of large farmer 5152.65 (14.37%) followed by medium small and marginal farmers which is 3267.17(9.72%), 1537.76(4.92%) and 1220.45(4.0%) respectively. Fertilizer cost was 1825.79(5.62%) on an average respectively which basis varies from 1543.40(5.06%), 1619.20(5.18%), 1894.76(5.64%) 2273.25(6.34%) and at marginal, small, medium and large farms. Cost of plant protection chemicals is increase with increasing the farm size and the same trend also observed in cost of fertilizer. Machine charges was 1985.31(6.11%) on an average basis respectively which varies from 1850(6.07%), 1920(6.14%), 2040(6.07%) and 2190(6.11%) at marginal, small, medium and large farms. The share of machine charges to total cost higher in large farmers. Interest on working capital was 217.59(0.66%) on an average basis and revenue charges shared same cost 12 rupees on all size of farmers which farmers paid to gram panchayat. Depreciation value rental value of land and interest on fixed capital shows the trends of increasing the farm size depreciation value is 382.23(1.17%) on an average basis and rental value of land incurred 12500 (38.47%) on an average basis of sample farmers followed by interest on fixed capital 838.12 (2.57%) respective with sample farm size. The Findings were supported by Chandan et al. [4] and Amutha, D. [5].

From the Fig 1, it is clear that total cost is maximum for large farmers (Rs. 35839.01), followed by medium farmers (Rs. 33587.90), small farmers (Rs. 31235.90) and Marginal farmers 30469.98. The total variable cost is more than total fixed cost in large farmers (Rs. 22048.33), followed by medium farmers (Rs.

17538.64), small farmers (Rs. 19814.24) and Marginal farmers (Rs.16802.84). Total fixed cost is Rs. 13667.14, Rs. 13697.20, Rs. 13773.64, and Rs. 13790.70 for Marginal ,small, medium and large farmers respectively.

Different cost on the basis of cost concept at sample farms: From the Table 2 it was seen that Cost A1, which includes all actual expenses, is Rs. 21327.42 at large farms, Rs. 17909.76at medium farms. Rs.15019.65 at small farms and Rs.13659.51 marginal farms. Cost A2, which includes cost A1 along with rent paid for leased in land, is same as A1, as there was no rent amount which was paid for leased in land. Cost B1, which includes cost A1 along with interest on value of owned fixed capital is maximum in large farms Rs. 22169.1, followed by medium farms Rs. 18750.4 small farms Rs. 15855.63 and marginal farms Rs.14493.65. Cost B2, which includes cost B1 along with rental values of owned land and rent paid for leased in land was 26993.65, 28355.63, 31250.4 and 34669.1 for marginal, small, medium and large farmers respectively. Similarly cost C1, which includes cost B1 along with imputed value of family labor is Rs.17969.98 for marginal, Rs. 18735.90 for small Rs. 21087.9 for medium and Rs.23.339.01 for large farmers. Cost C2, has cost B2 and imputed value of family labor as constituents as amount of Rs. 30469.98, Rs. 31236.5, Rs.33587.9 and Rs.35839.01 for marginal, small, medium and large farmers respectively. Cost C3 including cost C2 and 10% of cost C2 on account of managerial function performed by farmers is (Rs. 39422.91) for large farms, (Rs. 36946.69) for medium farms, (Rs. 34360.15) small farms and (Rs. 33516.97). All costs were comparatively higher at large farms followed by and medium, small and marginal.

The Fig 2 represents the overall amounts of various cost of cultivation components. It is clear from the above figures that maximum cost amount occurred in cost C3 followed by cost C2, B2, C1, B1, and A1, A2 with amounts of Rs. 35734.831, Rs. 32486.21, Rs. 19,986.21, Rs. 30269.42, Rs. 17769.42and Rs. 16931.3 respectively. The maximum cost occurred in Cost C3 which includes Cost C2 and 10% cost of C2 on account of managerial function performed by farmer, which is again maximum in large farms followed by medium and small farms. Whereas, the minimum cost occurred in Cost A1 and A2 which includes all actual expenses, however this is also maximum in large farms followed by medium and smallfarms.

Fig. 1. Total fixed cost, total variable cost & total cost Note: Figures indicate proportion of sum in parentheses

Fig. 2. Break-up of total cost and cost concepts

Yield, cost and return of Chickpea at the sampled farms: The Table 3 represents the yield and return of Chickpea. The average yield per ha from the sample farms was maximum in large (14.67qt) followed by medium (13.50qt), small farms (12.15qt) and marginal farms (11.75qt). The average price was 4500 for marginal, small medium and large farmers. The maximum cost of cultivation occurred in large farms (Rs. 35839.01), followed by medium farms (Rs. 31235.90) and marginal farms (Rs. 30469.98) which resulted due to farm size and amounts of input

expenditure. As far as cost of production per quintal is concerned, it is minimum in large farms which is Rs. 2443.00 followed by medium farms Rs. 2488.00 followed by small farms Rs. 2508.90 and maximum in marginal farms with Rs. 2593.18 per quintal.

Gross return was highest in large farms (Rs. 67013.00) followed by medium small farms and marginal farms with Rs. 61177.00, Rs.55083 and Rs. 53247.00 respectively. Net returns (gross return-Cost C) was maximum in large farms (Rs. 31173.99) followed by medium farms (Rs.

Fig. 3. Cost of cultivation, gross return and net returns at samplefarms

27589.1), again followed by small farms (Rs. 23847.10) and minimum in marginal farms (Rs. 22777.02) . Family labor income which equals to gross income after subtracting Cost B is maximum in large farms as compared to medium, small and marginal farms which accounts for Rs. 32343.9, Rs. 29926.6, Rs. 26727.27and Rs. 26253.35 respectively. Farm business income which includes gross income excluding Cost A1 is also maximum in large farms (Rs. 45685.58) followed by medium farms (Rs. 43267.24), followed by small farms (Rs. 40063.35), and minimum in large farms (Rs. 39587.49). Farm investment income which includes net income along with rental value of owned land and Interest on fixed capital is

maximum in large farms (Rs. 44017.67) followed by medium (Rs. 40930.64) followed by small(Rs.37183.08) and minimum in marginal farms (Rs. 36111.16). The input output ratio is maximum for large farms 1:1.85, followed by medium farms 1:1.82 followed by small farms, 1: 1.76 and minimum in marginal farms with ratio of 1: 1.74. Increased return from input in farms is maximum due to increased productivity aroused due to minimum cost incurred. The finding were supported by Sengar et al. [6] and Sharna et al. [7].

Income over different cost at sample farms: Income over different cost was also calculated for the sample farms (Table 4). Income over cost A1 was maximum in large farms (Rs. 45685.58) followed by medium farms (Rs. 43267.24), small farms (Rs. 40,063.35) and minimum in marginal farms (Rs. 13659.51). Income over cost A2 was also same as income over cost A1 following similar trend. Income over Cost B1 was Rs. 38753.35, Rs. 39227.37, Rs. 42426.6 and Rs. 44843.9 for marginal, small, medium and large farms respectively. Income over Cost B2 was Rs. 26253.35, Rs. 26727.37, Rs. 29926.60 and 32343.90 for marginal, small, medium and large farms respectively. Income over Cost C1 was maximum in large farms followed by medium, small and minimum in marginal farms with Rs. 43673.99, Rs.40089.10, Rs. 36347.10 and Rs. 35277.02 respectively. Income over Cost C2 was maximum in large farms followed by medium, small and minimum in marginal farms with Rs. 31173.99, Rs. 27589.1, Rs. 23846.5 and Rs. 22,777.02 respectively. Income over Cost C3 also follows similar trend with Rs. 27590.09, Rs. 24230.31, Rs. 20722.85 and Rs. 19730.03 in large, medium, small and marginal farms respectively. The overall income over Cost A1, A2, B1, B2, C1, C2 and C3 was Rs.42129.9, Rs.42129.9, Rs.41291.58, Rs.28791.58, Rs.39074.79, Rs. 26574.79 and Rs. 23326.169 respectively.

4. CONCLUSION

On an overall basis input-output ratio in chickpea cultivation was 1:81. On an overall basis net return in chick-pea cultivation was ₹ 26574.80 per ha. The average yield of chick-pea in the study area was 13.03 gt/ha which shows very satisfactory result in respect to average yield of Chhattisgarh i.e. about 1.01 gt/ha. The cost on the basis of cost concept in the production of chick-pea on the sample farm of different size groups have been overall Cost A1, Cost A2, Cost B1, Cost B2, Cost C1 Cost C2, and Cost C3 were worked out to ₹16931.30, ₹16931.30, ₹17769.42, ₹30269.42, ₹19986.21, ₹32486.21 and ₹35734.83 per ha respectively on the sample farms. The income over different cost were also worked out .the average income over cost A1, Cost A2, cost B1, cost B2, Cost C1 Cost C2, and Cost C3 were calculated as ₹42129.90, ₹42129.90, ₹41291.58, ₹28791.58, ₹39074.79, ₹, ₹26574.79 and ₹23326.16 respectively.
